

Who Complains — and Can We See It Coming?

Complainers Profile Analysis

Analyst: Nimrod Fisher
Date: 2026-04-19
Dataset: 50 accounts · 79 tickets

HEADLINE ANSWER

Plan, tenure, and engagement level do not reliably predict whether an account will complain — 82% of accounts file a ticket regardless. However, **platform activity spikes 1.6× in the 30 days before a first ticket** in 45% of Enterprise and Free accounts, providing a detectable early warning signal before the ticket is filed.

82%

accounts with ≥1 ticket

1.6×

pre-ticket activity spike (30-day)

45%

accounts show detectable pre-signal

94.7%

complaint rate, Enterprise

SUPPORTING FINDINGS

✓ CONFIRMED — H4

Activity builds up 30 days before complaints

Avg events jump from 8.0 to 11.2 in the month before a ticket (1.6× ratio). This is a *sustained buildup*, not a last-week spike. Holds in Enterprise (1.76×) and Free (1.62×); marginal in Pro (1.33×).

💡 ROUTING SIGNAL

Ticket type varies sharply by plan

Free = billing-heavy (35%). **Pro** = feature-request dominant (42%, only 1 billing ticket). **Enterprise** = even spread. Enables routing before reading ticket content.

⚠️ WEAK — H2

Enterprise has highest complaint rate

94.7% vs ~74% for Pro/Free — real but only 1.16× overall average. Far below the 2× threshold for a reliable predictor. Treat as usage norm, not signal.

🔍 OPEN QUESTION

May 2025 spike unexplained

21 tickets in May 2025 — 2.1× monthly average. Cause unknown. Notably, May accounts had *weaker* pre-signals; removing May strengthens H4 to 2.26×.

RECOMMENDATIONS

- 1 Build a 30-day rolling activity monitor (Enterprise + Free)**
Trigger proactive CS outreach when 30-day event count exceeds 1.5× prior 30-day average. The signal arrives before the ticket — this is the intervention window.
- 2 Route incoming tickets by plan tier**
Free → billing specialist; Pro → product team; Enterprise → general queue. Covers 70%+ of tickets following the category pattern.
- 3 Investigate the May 2025 spike root cause**
Cross-reference with product changelog, incident log, and billing renewal dates.
- 4 Extend pre-signal to event types (follow-up analysis)**
Which event types spike before a ticket? This sharpens the early warning model from volume to specific behavior triggers.

KEY CAVEATS

- Small dataset (n=50):** findings are directional; replicate on a larger account base before acting at scale.
- H4 window-dependent:** signal present at 30 days, weakens below threshold at 14 days. Use 30-day rolling window for monitoring.

- **H4 plan scope:** confirmed for Enterprise + Free; marginal for Pro.
- **Events gap:** event data starts 2025-03-07; 44% of tickets pre-date this window.
